

Options for gut management

The phytobiotic for superior gut management

Orego-Stim is a 100% natural phytobiotic feed additive containing pure oregano essential oil for use in pig diets. Orego-Stim not only enhances healthy gut function, but is also renowned for its other interesting properties.

Orego-Stim increases intestinal dimensions and villus-crypt depth ratio. By reducing the amounts of pathogenic bacteria in the intestines it allows for optimal growth and health of intestinal villi.

This provides a greater surface area for better absorption of nutrients leading to improved growth rates, feed conversion efficiency and reduced feed costs.

Field trials in various countries have proven that incorporating Orego-Stim in weaner and grower-finisher diets, regardless of the different health status of pig farms, can combat the negative effects of ileitis by improving FCR, preventing disease spread and the imperative need for regular antibiotic therapy.

Diarrhoea during lactation and post-weaning is a common problem where the regular use of antibiotics is also a common practice.

Orego-Stim reduces the frequency of diarrhoea during the late lactation

and post-weaning period, while preserving low mortality, maintaining a favourable daily weight gain and increasing productivity without the need for extra medication.

Orego-Stim also maintains a healthy gut flora. Continuous use of Orego-Stim will ensure that the numbers of pathogenic bacteria are kept at the lowest possible levels, while maintaining and preserving healthy levels of the beneficial bacteria populations in the intestines.

Besides its appetising effects, Orego-Stim also serves as a natural growth enhancer. When used in starter feed, its taste makes feed more desirable and suckling piglets quickly get accustomed to solid feed consumption. Being purely natural, there is no withdrawal period. Orego-

Stim leaves no residues in the meat and may be used continuously until the slaughter period.

Incorporating Orego-Stim into lactating diets results in more efficient utilisation of feed, thus helping the sow to increase milk production to support better growth and health status of its litter, leading to increased piglet survivability.

High performance natural additives

Evalis, specialist in animal nutrition since 1954, is launching its Neovia range of high performance additives. Neovia's goal is to bring value to producers using natural products.

The five products in the Neovia range are T5X, which binds mycotoxins and stimulates natural detoxification; B-Safe, which boosts the gastro-intestinal defence mechanisms; Stimune, which promotes the transfer of immunity in piglets; Oilis, which strengthens the intestinal walls and helps to control the risk of coccidiosis; and Cap'Acid, which safeguards digestion via controlled diffusion of these protected acids.

B-Safe, which is based on an innovative and patented mode of action, helps to maintain the digestive balance in monogastric animals. It is comprised of plant extracts and specific clays and limits the development of pathogenic gastrointestinal flora, while protecting the intestinal mucosa at the same time.

B-Safe enhances the zootechnical

performance results of animals and boosts breeding profitability, especially under difficult hygiene conditions.

The Neovia range uses natural products with demonstrated effectiveness. It was developed using the company's extensive research and development resources in order to target individual market needs more effectively. The company has a team of 100 international researchers based at five research centres across the globe (in Brazil, France, India, Indonesia and Vietnam).

This strategic choice provides unparalleled reactivity. Furthermore, Neovia research benefits from close partnerships with universities and independent R&D centres.

In-vivo models have been implemented to test the reliability of each innovation under conditions very similar to those encountered in practice: mycotoxin challenge, coccidiosis and enterocolitis models.
